Mailbox Systems

Mailbox systems are the link between information and the underworld. If you have ever called one, then you will know the advantages of having one, especially the ones that are open to whole underworld, rather than just a select few. There are two types of mailbox systems that are widely used.

The first type we will talk about is the multiple mailbox systems, or commonly referred to as message systems. These systems have several mailboxes set up on one number. Usually, you can access other mailboxes from that number by pressing '*' or '#'. Sometimes you just enter the mailbox number and you are connected. These are the safest systems to use to protect information from US Sprint and other long distance companies. Since US Sprint and other companies call the destination numbers, it is safer to have 800 mailbox systems, and most of the time, the multiple mailbox systems are on 800 numbers. The passcode on these systems can vary in length and can be accessed by several different methods, so it is impossible to explain exactly how to hack these systems.

The other type is the single mailbox system. These are usually set up in a reserved prefix in an area code. (Ex: 713-684-6xxx) These systems are usually controlled by the same type of hardware/software. To access the area where you enter the passcode, just hit '0' for a second or so. The passcodes are four (4) digits long. The only way to hack these is manually. The best thing you could do is to find one that does not have a recording from a person, but just the digitized voice. If you hack one that someone already owns, they will report it and it will not last as long.
