

"AFPO"

By RIPPER (UID# 25)

I changed my mind, I'll post how to make AFPO first. AFPO is the most commonly manufactured blasting agent in the world today, it far surpasses dynamite. HERES HOW TO MAKE IT;

NEEDED;

Amononium Hydroxide (again)

Fuel Oil(s)(white gasoline works)

Gelitin(no, NOT FLAVORED!)

Mix the AH with the FUEL OIL, until very thoughly mixed in to a thin liquid, then add the GELITIN, yes, this is a gel explosive, until you feel it's the right thickness for your work, you can get it thick enough to be solid, use waterproof fuses, with a little NI3 at the end to make sure the stuff goes off with a good boom, THIS IS A VERY STABLE EXPLOSIVE, IT IS ALSO 3 TIMES MORE POWERFUL THAN DYNAMITE. A thin wire with high vottage running through it in the gel makes a good detonater too.

Have you ever heard of the millitary high power explosive, NI3? It's 4 to 6 time MORE POWERFUL than dynamite, and, HERE'S HOW TO MAKE IT!

needed:

IODINE CRYSTALS

AMMONIUM HYDROXIDE

Put the AH in a GLASS bowl, and dissolve the Iodine in it, in a couple of minutes, new crystals will form,

AFPO.TXT

They are highly volatile, and illegal
to have, For what ever it's worth.

Do not DROP, CRUSH, HEAT, or FUCK
with them, take very extreme
precautions with them, pad them in an
air tight bottle.

ONE TEASPOON HAS THE IMPACT POWER OF
ONE M-100 FIRECRACKER.

Use them at your own risk!
